

ACADEMICS:

Just a quick progress update on the floor preparation process...

We are in the process of installing a gypsum based concrete, self-leveling compound to the second and third floors. It provides a level surface for the floor covering, it dampens sound transfer between floors and is a fire barrier between floors.

I found the process fascinating...so, here are some pictures from yesterday☺

The Chemistry room floor being poured.

A storage room...you can see the markers which help the installers get the correct thickness.

The Third floor hallway, looking towards Pel Court.

The “window” opening you can see a little way up, on the left, is the student store. The new “Senior” bench is a bit further up, on the right.

The completed Chemistry room in the curing process.
